EXECUTIVE SUMMARY

FOR THE MANAGEMENT OF THE
VETERINARY CLINIC “GUAU GUAU”

STAGE 4 - FROM NOVEMBER 11TH TO 24TH

INDEX

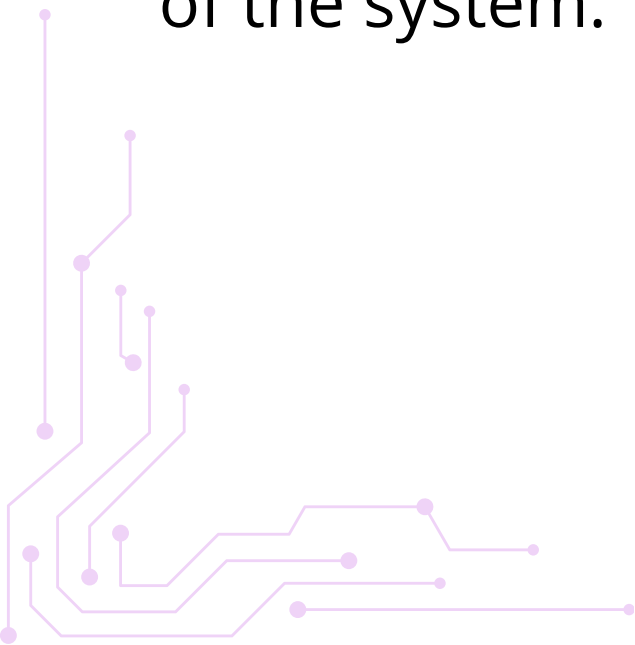

01	Introduction	3
02	Methodologies	4
03	Tests performed	5
04	Analysis and results	6
05	Evaluation of results	7
06	Implications	8
07	Recommendations	9
08	Conclusions	10

INTRODUCTION

This report summarizes the conclusions and results of the testing process carried out throughout the project for the veterinary management system "Guau Guau." The main objective of the testing was to evaluate the quality and functionality of the system. Throughout the different phases of the project, I conducted functional, non-functional, confirmation, and regression tests to identify and address any issues that could affect the integrity and usability of the system.

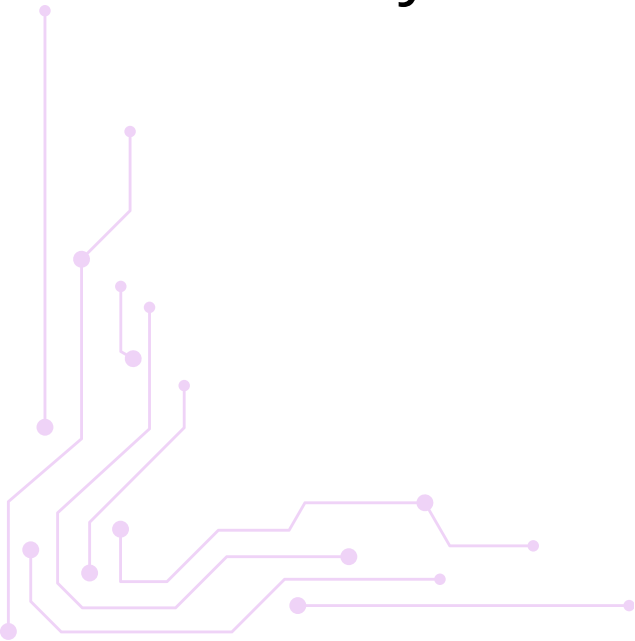

METHODOLOGIES

To carry out the testing, various tools and methods were used. The main tools utilized were Mantis for bug tracking, Excel for documenting test cases and results, and Trello for task and workflow management.

Information was gathered through functional tests, performance tests, and security tests, ensuring comprehensive coverage of all aspects of the system.

TESTS PERFORMED

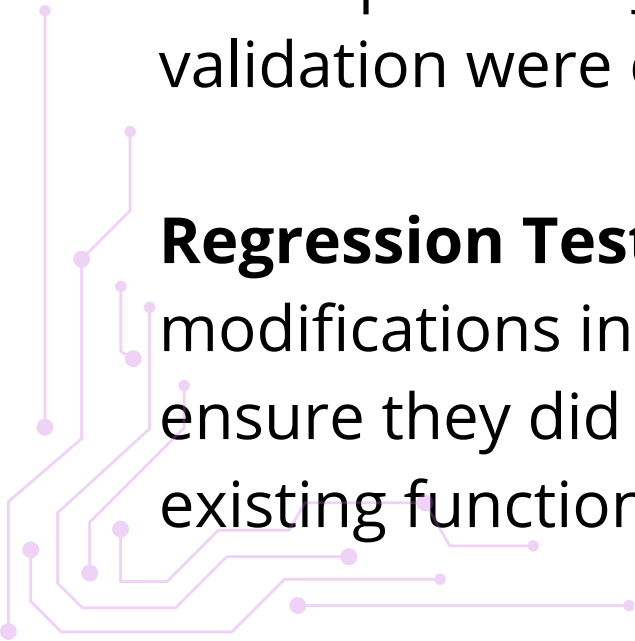

Types of Tests Implemented:

Functional Tests: I verified that the various fields in the forms and Login could not be left empty and that, when entering invalid data, an error message was displayed and the registration could not proceed.

Non-Functional Tests: I evaluated the fidelity between the design and the implementation.

Confirmation Tests: I verified that the errors previously identified in data validation were corrected.

Regression Tests: I tested the new modifications in the validation logic to ensure they did not negatively affect existing functionalities.

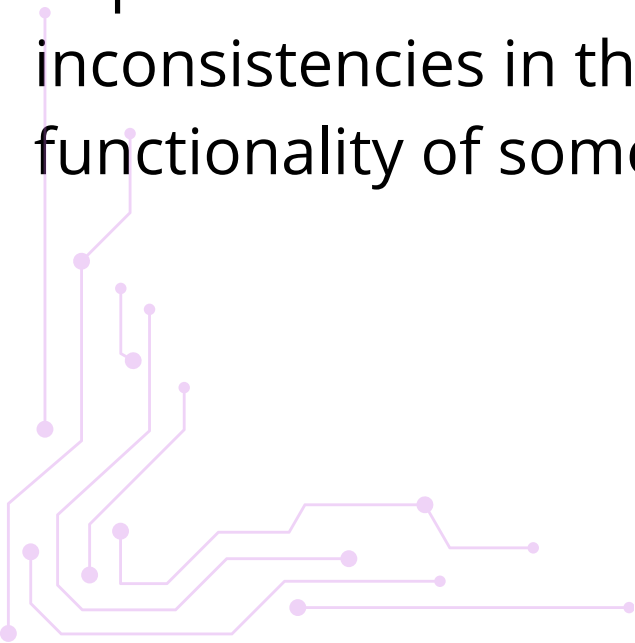

ANALYSIS AND RESULTS

Validation Errors: Problems were identified in the validation of error messages, especially in the entry of duplicate data and invalid data (CP23 to CP36).

Inconsistencies in Error Messages: Although the system displayed warning messages for empty fields, it allowed invalid data to be registered without blocking the action (CP23 to CP36).

Difference between Mockup and Implementation: A discrepancy was observed between the mockup design and the final implementation of the system, causing inconsistencies in the presentation and functionality of some features (CP88).

EVALUATION OF RESULTS

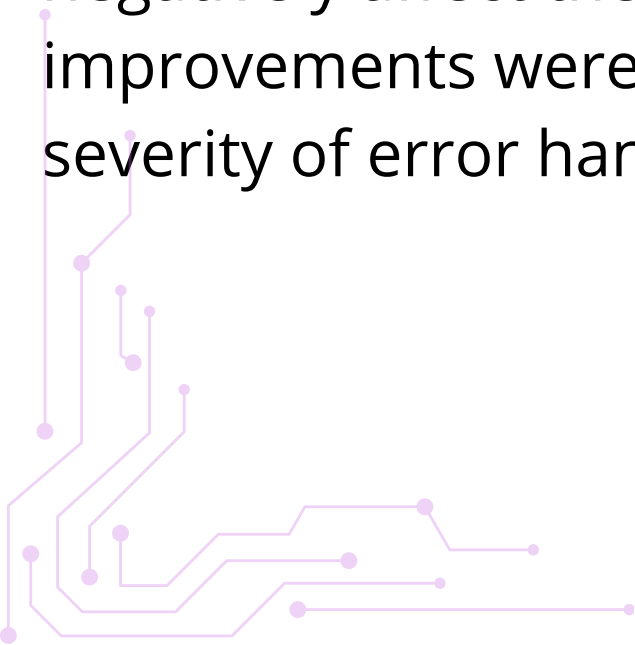

Functional Tests: Most of the system's functions operated correctly, but errors in data validation were identified and reported.

Non-Functional Tests: There was a discrepancy between the mockup design and the final implementation, causing inconsistencies in the presentation and functionality of some features.

Confirmation Tests: My tests continued to show errors, so they had to be reported again.

Regression Tests: The new modifications did not negatively affect the functionalities, and certain improvements were implemented to mitigate the severity of error handling.

IMPLICATIONS

- 1.** The need for continuous improvement in validation logic and error management.
- 2.** The importance of thorough testing and collaboration in software development.
- 3.** The importance of aligning the mockup design with the final implementation to avoid inconsistencies.

RECOMMENDATIONS

Suggested Actions:

- Continue refining the validation logic to cover all possible error scenarios.
- Align the mockup design with the final implementation to ensure consistency in the presentation and functionality of the system.

Next Steps:

- Conduct additional tests to ensure that error messages are displayed correctly in all sections of the system.
 - Review and adjust the mockup design to match the final implementation.
- 

CONCLUSIONS

The tests conducted revealed several areas for improvement in data validation and the consistency between the mockup and the final implementation. Despite efforts to improve the validation logic, the system still has issues displaying error messages in all sections except the login. Regression tests showed that the new modifications did not negatively affect existing functionalities, and improvements were implemented to mitigate the impact of errors.
