

FINAL TESTING EXECUTIVE REPORT

Stage 4 - From November 11th to November 24th

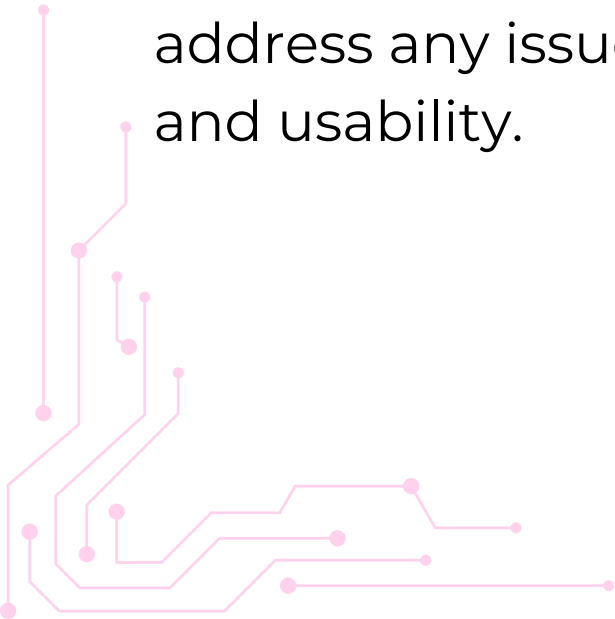

By: Agostina Barboza, Ana Osaba, Arianna Delgado, Pía Alvira, Yuvel Cocco.

INDEX

01	Executive Summary	03
02	Methodologies	04
03	General Conclusions	05 - 06
04	Key Results	07 - 09
05	Final Observations and Recommendations	10
06	Acknowledgements	11
07	Final Conclusion	12
08	Links	13

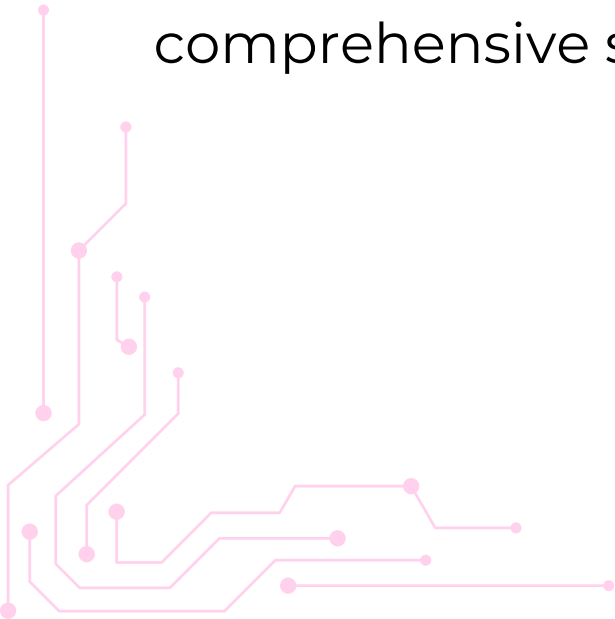

EXECUTIVE SUMMARY

This report presents the results of the testing process conducted by the *Empower Test Team* for the 'Guau Guau' Veterinary management system. The primary objective of the testing was to evaluate the quality, functionality, security, and performance of the system. Throughout the different phases of the project, the team has diligently worked to identify and address any issues that could impact the system's integrity and usability.

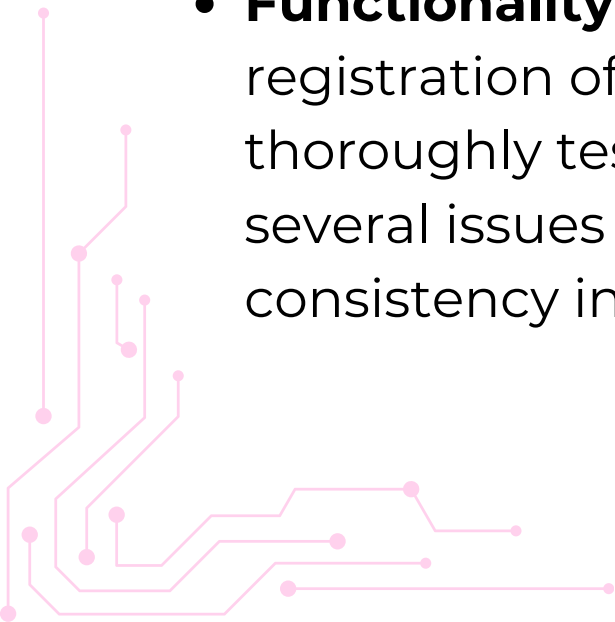

METHODOLOGIES

To conduct the tests, we utilized various tools and methods, including Mantis for bug tracking, Excel for documenting test cases and results, and Trello for task and workflow management. We performed functional, non-functional, confirmation, regression, and exploratory tests to ensure comprehensive system coverage.

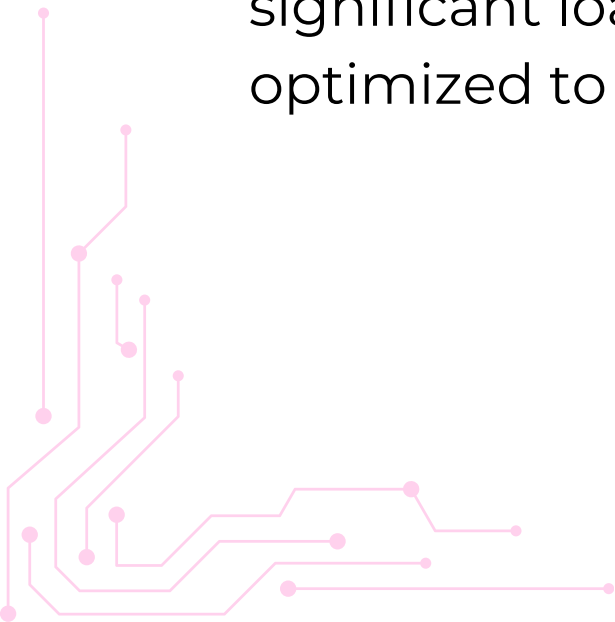

GENERAL CONCLUSIONS

- **Software Quality:** The software has demonstrated acceptable quality in terms of stability and reliability, though several issues remain unresolved and need to be addressed. Regression testing conducted during each iteration confirmed that new implementations did not introduce problems in existing areas. However, some errors from earlier stages were not corrected.
- **Functionality:** Key system features, such as login and the registration of users, clients, pets, and vaccines, were thoroughly tested. While most functions operate as expected, several issues require attention, including data validation and consistency in the user interface.

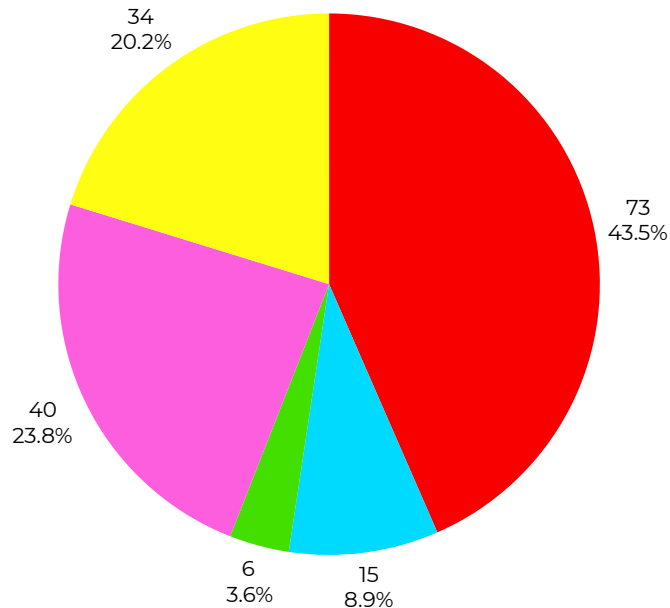

GENERAL CONCLUSIONS

- **Security:** The system passed some security tests, but vulnerabilities were identified that need to be addressed.
- **Performance:** Performance tests indicate that the system maintains acceptable response times, even under significant load conditions. Critical areas have been optimized to ensure a smooth user experience.

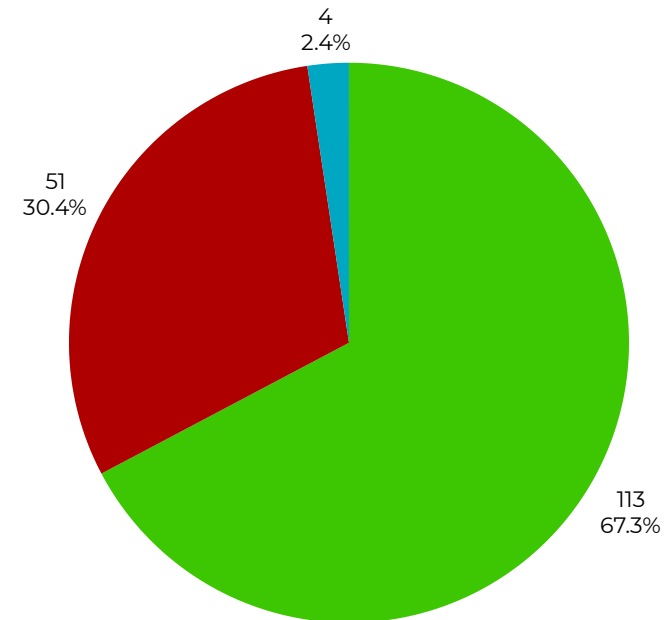

KEY RESULTS

1. Test Coverage Percentage: The team managed a total of 168 tests, distributed as follows: 73 regression tests, 15 confirmation tests, 40 functional tests, 34 non-functional tests, and 6 exploratory tests. Of these, 113 tests passed, 51 failed, and 4 remained blocked.

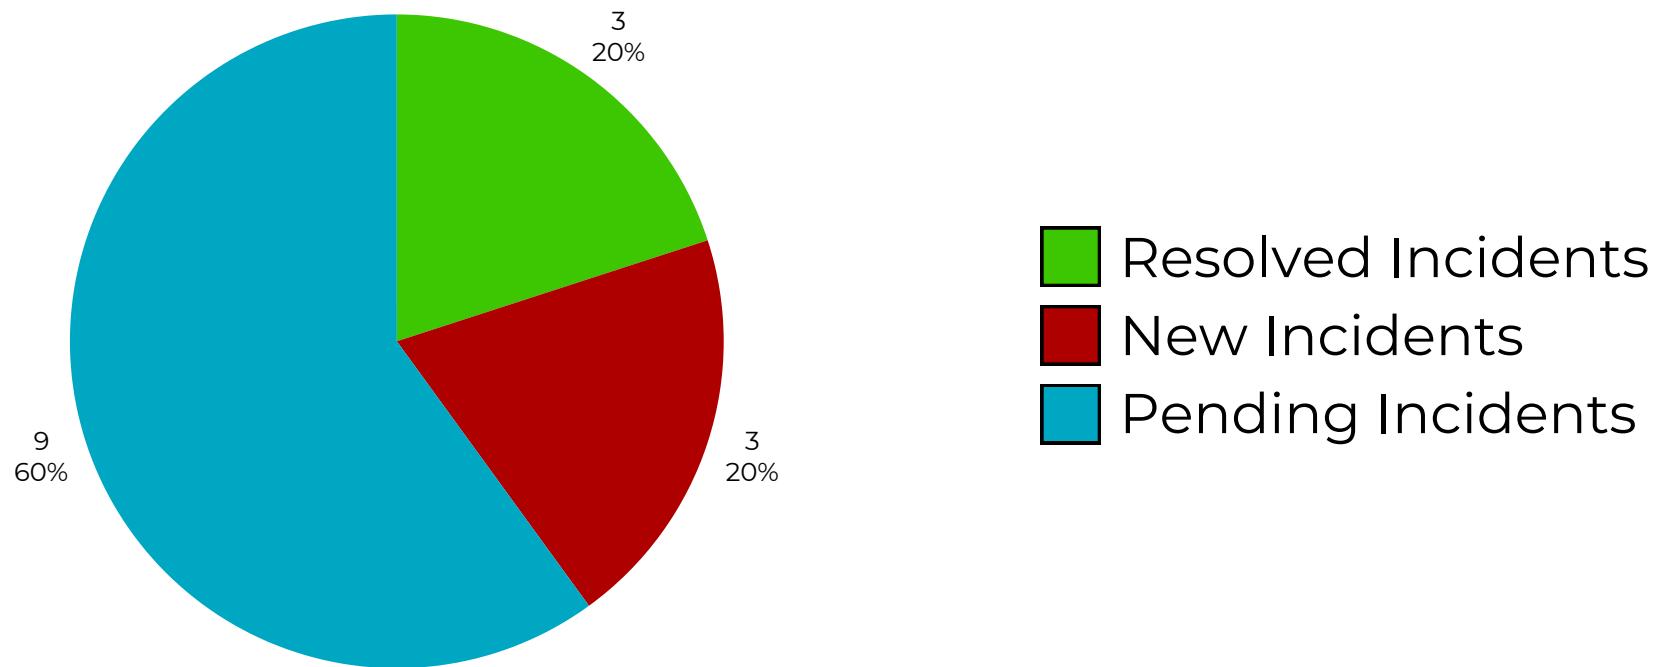

- Regression Tests
- Confirmation Tests
- Exploratory Tests
- Functional Tests
- Non-Functional Tests

- Passed Tests
- Failed Tests
- Blocked Tests

KEY RESULTS

2. Number of Resolved Errors: Out of the 15 incidents reported in the Stage 2 report, 3 were resolved, and 3 new incidents were added by the end of the testing project.

KEY RESULTS

3. Response Time Statistics: The average response time remained below 2 seconds.

4. Security Evolution: Due to the database connection issue, the planned critical vulnerability tests could not be performed. Therefore, it is not possible to determine the percentage reduction of critical vulnerabilities since the start of the project.

FINAL OBSERVATIONS AND RECOMMENDATIONS

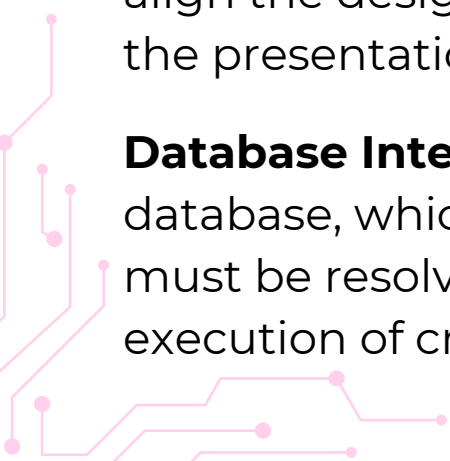

Throughout the course of the project, various situations and challenges were observed and addressed. Some final observations and recommendations include:

Persistent Errors: Some errors identified in earlier stages were not corrected in the current stage. It is crucial to address these issues to improve software quality and prevent them from accumulating in future stages.

Data Validation: Issues were identified in data validation, particularly in the entry of email addresses and invalid characters. It is recommended to enhance the validation logic to cover all possible error scenarios and ensure the integrity of entered data.

User Interface Consistency: Inconsistencies were observed in the presentation of the user interface across different browsers. It is important to align the design layout with the final implementation to ensure consistency in the presentation and functionality of the system across all browsers.

Database Integration: The management system is not connected to the database, which affects the integrity and modularity of the system. This issue must be resolved to ensure efficient data management and enable the execution of critical vulnerability tests.

ACKNOWLEDGEMENTS

We would like to express our sincere gratitude to all the members of the development and testing teams, as well as all involved parties. Your dedication, effort, and collaboration have been fundamental to the progress and success of the project. We especially thank the developers for their tireless work in implementing functionalities and fixing errors, as well as the testing team for their meticulous attention to detail and commitment to quality. Without the collective effort of everyone, this project would not have been possible. Thank you all for your hard work and dedication!

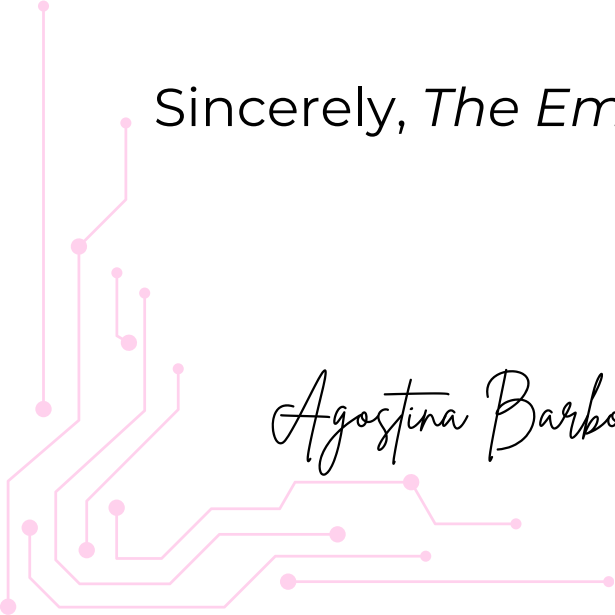

FINAL CONCLUSION

The project for the 'Guau Guau' Veterinary has been successfully completed. The developed software has undergone a rigorous testing process, ensuring that it meets quality and security standards. We are confident that the final product will provide significant value and meet the expectations of our clients.

We are available for any further inquiries or future collaboration.

Sincerely, *The Empower Test Team.*
